

AlgoWorkforce Operations & Configuration Guide

User-Friendly Platform Manual • Version 1.0

1. Platform Overview

Welcome to **AlgoWorkforce**, the intelligent enterprise workforce platform designed to automate across-the-board operational departments seamlessly. Every department in your organization operates a dedicated AI agent that functions 24/7/365 to field queries, retain full operational context, ingest internal knowledge base repositories, and safely hand off to human operators when appropriate.

Core Department Roles Matrix

Agent Persona	Assigned Departmental Scope & Role
Receptionist	Acts as primary gateway. Greets inbound traffic, dynamically identifies intent, and routes pipelines to dedicated departments.
Customer Care	Owns end-to-end support loops, ticket logging, user feedback logs, and customer follow-up actions.
Sales	Delivers deep product specifications, handles dynamic pricing inquiries, qualifies inbound leads, and schedules product demonstrations.
HR	Manages company policy inquiries, calculates leave balances, and facilitates internal employee onboarding paths.
Finance	Assists with invoice generation tracking, billing inquiries, transaction verifications, and financial reporting requests.
IT Support	Provides deep technical triage, system troubleshooting frameworks, and automated engineering ticket creation.
Marketing	Answers inquiries regarding running promotional campaigns, enforces core brand guidelines, and offers targeted content support.

2. Getting Started & Initialization

Deploy and execute the platform through your chosen target environment using the following configurations:

- **Production Environment (VPS Real-time URL):** <https://www.algoworkforce.com>
- **Local Testing (Docker Sandbox Loop):** `http://localhost:3200`

Role Authentication Credentials

Access Tier	Standard System Username	Out-of-Box Default Password
Platform Administrator	<code>admin</code>	<code>admin123</code>
Operational Support Agent	<code>agent</code>	<code>agent123</code>

Mandatory Security Action Required: To prevent data breaches, change your out-of-the-box system default passwords immediately following your initial platform authentication via **Settings** → **Profile Options**.

Initial Admin Setup Checklist

- ☐ Authenticate and access your dashboard with `admin` credentials.
- ☐ Open **Settings** → **Company & Agents** to standardize corporate branding fields, target taglines, and initial telephone scripts.
- ☐ Navigate to the **Knowledge Base** panel and upload structured files (PDFs, Markdown, text sheets).
- ☐ Execute a test conversation session directly with the **Sales Agent** to ensure documentation ingestion is live.
- ☐ Initiate a test voice communication sequence within the **Voice Console** to verify your microphone interface.

3. Interfacing with Chat & Voice Channels

The platform coordinates user engagement across two interactive primary interface consoles:

FIGURE 3.1: PLATFORM NAVIGATION SIDEBAR MATRIX VIEW

Natural Conversational Department Transfer Protocols

Users don't need to manually navigate menus to change departments. The underlying AI engine continuously parses conversation strings to catch routing intent. When an explicit department switch request is spotted, it shifts the active session context over automatically.

Supported Hand-off Phrases: *"Transfer me to Sales please" • "I need to query our HR group" • "Connect me directly to the Finance desk".*

Voice Console Multi-Language & Dialect Codes

Target Language Group	System ISO Code	Deployment Operational Guidelines
English (Global Standard)	en	Provides the highest foundational transcription accuracy.
Hindi	hi	Full localized accent compatibility and native phrase ingestion.
Tamil	ta	Complete regional script and vocal character mapping support.
Telugu	te	Optimized speech recognition arrays for high clarity.
Kannada	kn	Fully calibrated phonology and parsing matrices.
Malay	ms	Fully optimized for regional accents and Singlish speech cross-overs.
Mandarin / Hokkien	zh	Intelligently standardizes structural Hokkien dialects directly into Mandarin.

4. Enterprise Knowledge Base Architecture

The platform relies on a vector space database engine to supply localized facts to your agents. This protects responses against hallucinations by anchoring your AI departments with factual corporate documentation.

Directory Alignment Map for Files

For pristine isolation across department agent queries, organize file uploads using this category mapping structure:

```
📁 Corporate Knowledge Base Ingestion Mapping
├── 📄 products-catalog.txt      ➡ [Category Tier: Sales]
├── 📄 pricing-guide.csv         ➡ [Category Tier: Sales]
├── 📄 hr-policies.pdf           ➡ [Category Tier: HR]
```

└─  leave-policy.docx	→ [Category Tier: HR]
└─  faq-customer.md	→ [Category Tier: Customer Support]
└─  it-support-guide.json	→ [Category Tier: IT Support]

5. Advanced Troubleshooting & Fail-Safes

If you encounter configuration edge cases, use this matrix for direct tactical fixes:

Observed System Error	Root Cause Analysis & Triage Remediation Path
Documents remain stuck in a eternal <code>pending</code> status badge	1. The file might be a flat scanned image lacking an explicit OCR textual layer. 2. Check the docker cluster loop state: Run <code>docker compose ps chroma</code>. 3. Purge the stuck document ID and execute an explicit re-upload cycle.
AI responses completely bypass custom corporate documentation facts	1. Ensure document ingestion status has fully hit the complete state badge. 2. Run an explicit verification check via the Semantic Search diagnostic panel. 3. Double check the file upload Category. If a file maps to HR, the Sales agent will intentionally ignore it.
"401 Unauthorized" issues surface inside KB or configuration tabs	1. System JSON Web Tokens (JWT) automatically expire every 8 hours for enterprise safety. 2. Perform an explicit user logout and log back in to refresh active session tokens.
Persistent database loss occurs across service or container restarts	Your <code>docker-compose.yml</code> file lacks persistent volume configuration maps. Ensure your setup mirrors the following structured configuration: <pre>chroma: volumes: - chroma_data:/chroma/chroma environment: - IS_PERSISTENT=TRUE - CHROMA_SERVER_PERSIST_PATH=/chroma/chroma</pre>

Critical Administrative Directive: Never run the command `docker compose down -v` inside production environments. The inclusion of the `-v` flag completely wipes out all persistent underlying database storage volumes.

6. Data Protection & Administration

Secure Infrastructure Backups

To schedule automated safe snapshots of active transactional database histories, run this dump utility via your server terminal console:

```
# Connect to the localized active postgres container and generate an independent dump file
docker compose exec postgres pg_dump -U workforce workforce > backup_$(date +%Y%m%d).sql
```

Privacy Framework Compliance Notice: All chat logs, transcribed audio clips, and vector data are kept on your private infrastructure. AlgoWorkforce does not track, intercept, or look at your corporate data.
